

Bridge Central London Skills Partnership

Digital case study:

Industry and Education Collaboration

Mo-Sys is an industry-leading virtual technology company that primarily develops equipment, including software, mechanical, and electronic components. Their focus is on making technology accessible and creating innovations for media and entertainment that support content production. Mo-Sys has revolutionised filmmaking, significantly reducing post-production time and costs while also creating new skills and employment opportunities.

To remain competitive, particularly with the rise of AI in this sector, embracing this technology and upskilling are vital. Mo-Sys creates an environment for testing this technology and one that supports professionals already working in the sector in upskilling. Incorporating industry, education, and creatives requires effective communication to understand the industry's needs and skills gaps.

To address these issues, Mo-Sys developed an academy by partnering with Access Creative College. Learners were given placements at Mo-Sys, which enabled them to conceptualise a future in the industry.

Benefits of the collaboration:

- Development of industry-ready curricula to address the skills gaps of an evolving industry
- Opportunities for learners to build confidence through hands-on work experience, where exploring their passions and curiosity is encouraged
- Guidance in equipping the college studio space with the most efficient technology for current and future productions.
