

Bridge Central London Skills Partnership Digital case study: St. Francis Xavier Sixth Form College

St. Francis Xavier Sixth Form College's installation of a new film studio became a game-changer for their digital innovation strategy and the broader creative curriculum. As part of the LSIF project, the new facility has elevated its media provision and opened opportunities for cross-departmental collaboration and student-led innovation. It has become a creative hub where learning, technical skills, and imagination converge, significantly enriching the educational experience for learning communities.

The benefits of the film studio have extended well beyond the boundaries of their media curriculum. It has become a shared resource used creatively by various departments. This cross-curricular adoption has been one of the most rewarding outcomes of the project. Staff from different subject areas have collaborated with the digital media team to design new forms of assessment and storytelling tailored to their learners' strengths.

The studio has facilitated a shift away from traditional, linear modes of evaluation towards more interactive, reflective, and learner-driven outputs. It supports a more holistic approach to education, where digital literacy, communication, and creativity are integrated across all learning experiences.

Impactful outcomes:

- Development and launch of **The Media Plug**, a current affairs TV show produced entirely by T Level Media, Broadcast and Production learners
- A weekly series of **Skills Builder Sessions** focused on hands-on experimentation with studio technologies, where learners refine their practical abilities and explore creative risk-taking and idea development.

“ *The film studio stands as a testament to the power of investment in purposeful, student-focused digital innovation. It exemplifies what is possible when creative infrastructure, curriculum design, and learner ambition come together.* ”
